ARC ADS WORKSPACE TUTORIAL

How I Made My AI Clone Video in Arcads

The exact beginner-friendly workflow: from your real video and audio to a finished AI clone video.

No trained Talking Actor. No extra room node. No complicated identity-sheet build.

Want to try Arcads yourself? Start here: https://arcads.ai/?via=jianna

What you are making

One vertical, 30-second UGC video built in Arcads Workspace with reference images, a reference audio recording, and one detailed master prompt.

JIANNA CAPRI • SEPTEMBER 2026

READ THIS FIRST

The whole workflow in 60 seconds

You will upload a few clear frames of yourself, upload a clean recording of the exact script, let Arcads build a simple Workspace, replace the generic prompt with the full master prompt, check the video settings, and run it. When the render comes out, your clone video is ready.

YOU NEED BEFORE YOU START

- A clean 29-second voice recording of your final script
- 3 screenshots from one source video, all in the same hair and outfit
- At least one front view, one slight angle, and one smiling/mid-speech frame
- The first Workspace prompt and master prompt from this guide
- Enough Arcads credits for a 30-second Seedance 2.5 render

DO NOT ADD

- A Talking Actor node
- A separate room image unless your first render truly needs one
- Photos with different hair, outfits, lighting, or ages
- Music in the reference audio
- Extra nodes just because another workflow looked more complicated

The important distinction

Talking Actors uses a trained clone, but it inherits the look of the training video. This tutorial uses Arcads Workspace / Video generation. Here, your identity comes from the reference images, your performance comes from the reference audio, and the room/action comes from the prompt.

Quick map

- 1. Prepare your real video, screenshots, and script
- 2. Record the reference audio
- 3. Open Arcads Workspace and paste the first prompt
- 4. Let Arcads build the nodes
- 5. Replace the image(s), audio, and generic prompt
- 6. Check Seedance 2.5 settings and run

PART 1

Prepare your source material

1 Choose one real source video of yourself

Use a clip where you look like the version of yourself you want the AI video to copy. Keep the same hair, makeup, outfit, and general look across every screenshot you use.

2 Pull 3 useful screenshots

Use the same look across all three: a normal front-facing frame, a slight side angle, and a frame where your mouth is open naturally or you are smiling. That is exactly what Jianna used. You can add more reference images later if you need extra angles or mouth expressions.

More is not automatically better

A few clean, consistent references beat a pile of mixed-quality photos. If one photo shows different hair, clothes, lighting, or facial proportions, delete it.

3 **Write the exact script**

Keep the final words locked before you record. The audio length and the video length must match closely. Jianna's final read was 28.6 seconds inside a 30-second generation.

The exact script used

It's honestly scary how good AI has gotten because I bet you thought that this was actually me.

But I literally cloned myself.

The voice you're hearing right now is a clone.

This video of me isn't real, and this room I'm in doesn't exist.

I made my clone in Arcads in like ten minutes from one video.

Then I made this video from a single prompt.

If you want the exact prompt I used, comment "clone" and I will send it to you.

4 **Record the audio cleanly**

Read naturally at conversation speed. Use a quiet room. No music, echo, or background noise. Leave your real pauses and breaths in. The prompt timestamps must match this exact recording.

PART 2

Build the Workspace

5 **Open the Workspace / node builder**

Use the Arcads Workspace that begins with the "describe what you want to create" box. This box only builds the scaffolding. It is not where the full master prompt belongs.

6 **Paste this exact first prompt**

This is the short instruction Jianna used to make Arcads create the starting node pipeline.

A 30-second vertical 9:16 UGC-style video of a woman filming herself selfie-style, walking into a Bali villa bedroom holding a coffee, setting the phone down on a desk, sitting at a laptop and speaking to camera. Use my attached reference images for her face and identity. Use my attached audio file as the exact voiceover, lip-synced. Single continuous take, realistic handheld phone footage, Seedance 2.5 for video generation.

7 **Click Go to build the nodes**

This creates the pipeline. It does not generate the video yet, so this step should not spend generation credits.

Your finished Workspace should be simple

INPUT NODES

- 3 image uploads, all wired to the video node's IMAGE input
- 1 audio upload, wired to the video node's AUDIO input
- 1 text/prompt input containing the full master prompt

OUTPUT NODE

- 1 video generation node
- Model: Seedance 2.5
- Aspect ratio: 9:16
- Length: 30 seconds
- Audio Enabled: ON

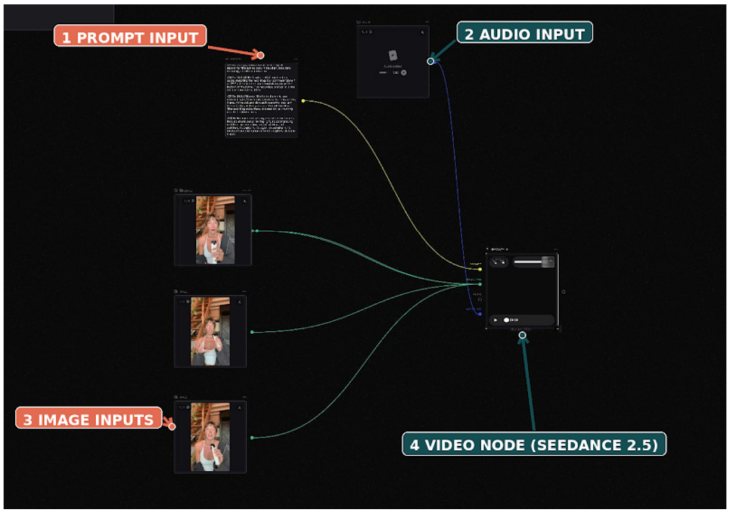

You do not need a room node

The Bali bedroom was created entirely from the SETTING section of the master prompt. Add a room reference only if a later test shows a specific room problem. Every extra reference can compete with the identity references.

WORKSPACE MAP

What the finished workflow looks like

This is Jianna's real Arcads Workspace, cropped to remove account details and labeled so you can see the four parts. The exact number and position of your nodes may differ. The connections are what matter.

Follow the wires

The yellow prompt wire, blue audio wire, and green image wires all feed the same Seedance video generation node. If one input is not wired in, the video node cannot use it.

PART 3

Replace the generated nodes

Arcads may prefill the Workspace with generic placeholders. Replace the content, not the wiring.

8 **Replace the image reference(s)**

Click an existing image node. If the node lets you add more images, use the + beside the image count and upload your selected frames. If it does not, double-click the canvas, choose Upload, add each image, then drag each new node's output dot to the video node's IMAGE input.

9 **Replace the audio**

Click the audio node. Delete or replace its file with your clean final recording. If you are replacing the file inside the same node, the wire should stay connected. Confirm the new waveform/file is present before running.

10 **Replace the generic prompt**

Click the large video generation node. Find its prompt field. Delete the short generic description Arcads created and paste the complete master prompt from the appendix of this guide. Paste the whole thing, including REFERENCE ROLES, timestamps, behavior, and AVOID.

Do not paste the master prompt in the first describe box

The first prompt builds the plumbing. The master prompt directs the actual video. It belongs in the video generation node's prompt field.

11 **Confirm every wire**

Before running, verify: every image reaches IMAGE; the audio reaches AUDIO; the long text reaches the video prompt; and nothing important is sitting unconnected.

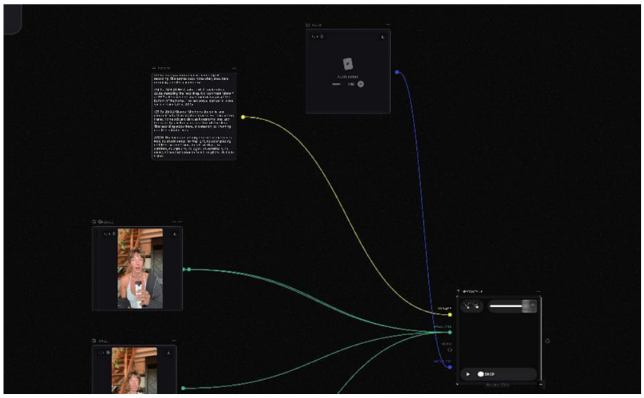

If you need to swap something later

- New audio: replace the file inside the audio node. Keep the wire.
- More mouth/teeth reference frames: add them to the image feed or add Upload nodes and wire each one to IMAGE.
- New script timing: record the new audio first, then update every dialogue timestamp and action beat in the master prompt.
- Different outfit: use a consistent new set of identity frames and update WARDROBE. Do not mix old and new looks.

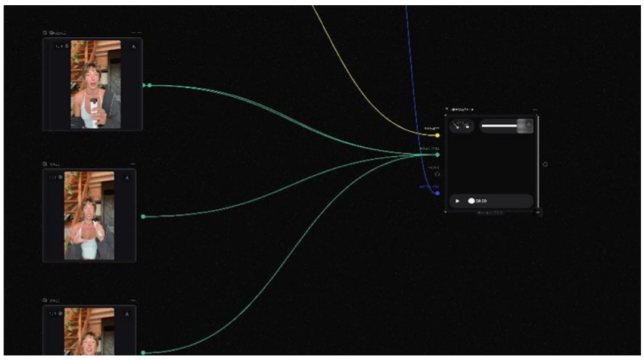

NODE CLOSE-UPS

Where each replacement goes

These close-ups come from Jianna's finished Workspace. They show the actual prompt and audio nodes, and the image nodes wired into the video node. Private account details are cropped out.

The full master prompt and the final 29-second recording each live in their own node.

Every image node's wire must land on the video node's IMAGE input.

PART 4

Check settings and run

12 **Open the video generation node**

Do not trust the Workspace description alone. Inspect the actual generation settings in the

Do not trust the Workspace description alone. Inspect the actual generation settings in the final video node.

Final pre-run settings

SETTING	VALUE
Model	Seedance 2.5
Aspect ratio	9:16 vertical
Length	30 seconds
Audio	Enabled / ON
References	3 consistent images + one clean audio file
Prompt	Full master prompt, not the short Workspace prompt

13 **Run the workflow**

If the images, audio, master prompt, wires, and settings all match, hit RUN. Generate one version before adding extra nodes or changing several things at once.

Known Seedance 2.5 behavior

Even with reference audio, Seedance may re-voice or slightly change words instead of passing the recording through exactly. In Jianna's first render it changed "myself" to "herself" and mispronounced Arcads. Small word changes like this are normal. Jianna kept the Arcads audio exactly as it came out because the voice quality was good.

PART 5

Review the first render

Watch once for the overall effect. Then watch again and check one category at a time.

KEEP IT IF	FIX ONE THING IF
• The face reads as you	• The face drifts between angles
• The hair and outfit stay consistent	• The mouth shows too many teeth
• The walking-to-desk action is understandable	• The audio changes your words
• The mouth timing is close enough to the audio	• The room looks too polished or cinematic
• The room and lighting feel natural	• The camera jumps or creates cuts
• The hands and props are acceptable	• A reference image is fighting the intended look

Fast fixes

Face drift	Use fewer, cleaner reference frames from the same look. Put the identity instruction first in REFERENCE ROLES.
Wrong mouth or teeth	Add one or two clear smiling/mid-speech frames. Keep the MOUTH AND TEETH section.
Timing feels off	Use the exact audio that the prompt was timed to. If the read changes, update the timestamps.
Room is too glossy	Remove "hyper-realistic." Keep amateur iPhone framing, one-sided daylight, imperfect movement, and no cinematic grading.
Hands break	Simplify the physical action before adding more negative instructions.
Camera cuts or jumps	Keep ONE UNBROKEN TAKE and clarify that timestamps are action markers, not shot boundaries.

COPY + PASTE

The exact master prompt

Paste the following into the prompt field inside the final video generation node. This is the exact version Jianna used for her final render.

Before using it for your own video

Change the dialogue, timestamps, setting, wardrobe, and actions to match your own recording and references. Keep the structure. Do not claim another person's exact identity or use someone's likeness without permission.

What each section controls

- REFERENCE ROLES: tells Arcads what each file is allowed to define.
- ONE UNBROKEN TAKE + TIMESTAMPS: prevents the model from interpreting every timestamp as a cut.
- SETTING + CAMERA + LIGHTING: builds the world without a separate room node.
- MOUTH AND TEETH + DELIVERY: controls speaking behavior.
- DIALOGUE + CONTINUOUS BEHAVIOUR: locks the words and keeps the person alive between lines.
- THE RECORDING, IN ORDER: choreographs the full 29 seconds.
- AVOID: blocks the most common visual failures.

MASTER PROMPT / EXACT COPY

REFERENCE ROLES. The attached reference materials define specific elements and nothing else. The attached images collectively define her face, identity, hair and wardrobe — copy her likeness from them exactly. Several of the images show her smiling and mid-speech; they also define how her mouth moves when she talks and smiles, per MOUTH AND TEETH below. Every image is the same woman in the same look; treat them as one identity. — copy her likeness from it exactly. @audio1 is the complete and only voiceover for this video — it is the master clock, and every line of dialogue below is lip-synced to it at the timestamps given. Do not generate any other voice. Do not copy environment, lighting or camera behavior from any reference; those come only from this prompt.

ONE UNBROKEN TAKE. Twenty-nine seconds of continuous recording from a single camera that never stops rolling. There are no cuts, no edits, no transitions, no jumps, no angle

ONE UNBROKEN TAKE. Twenty-nine seconds of continuous recording from a single camera that never stops rolling. There are no cuts, no edits, no transitions, no jumps, no angle changes, no reframing, no shot changes. Time never skips. This is one single continuous recording from beginning to end.

ABOUT THE TIMESTAMPS BELOW. The timestamps mark when things occur inside the one continuous take. They are not shot boundaries, not clip divisions, and not edit points. Nothing changes at a timestamp except what she is doing. The camera keeps rolling straight through every one of them. The dialogue timings below match the provided voiceover recording exactly — her recorded delivery is the master clock for this video.

NO DEAD AIR. She never stops, stares, or holds a blank expression between actions. Her pauses are filled with small physical business — setting down her glass, shifting in the chair, a breath, a glance — so movement, speech and activity run continuously and overlap throughout.

NO VISIBLE PHONE OR DEVICE (except the laptop). The camera is her phone. No phone, screen, handheld device or recording equipment appears anywhere in frame at any point except the laptop on the desk. During the opening she is carrying the camera — her right arm is extended toward the lens at a natural selfie distance and heavily foreshortened at the frame edge, and her hand is out of frame. Exactly two arms, five fingers per hand.

FORMAT. Vertical 9:16. Front-facing phone camera in selfie mode. Mild wide-angle distortion, slight natural handheld micro-movement throughout.

SETTING. A warm, minimal bedroom in a Bali villa, morning. White linen bedding slightly unmade on a low wooden bed frame. A rattan pendant light overhead, off. Sheer white curtains on a large window with soft green tropical foliage blurred outside. Light wood floors. Against the wall near the window, a small light-wood desk with a closed silver laptop, a tall skinny glass of iced latte, condensation beading on the outside, and a small stack of books. A potted plant in the corner. Lived-in and real, not styled. No text, no logos, no watermark anywhere.

CAMERA GEOMETRY. The camera ends up resting on the desk, propped, facing the desk chair. After it is set down it never moves again — every change in the image from that point comes from her movement, never from the camera. She sits facing the desk, three-quarter angle, slightly left of center in frame. The unmade bed is visible soft in the background over her shoulder. Her eyeline moves between the lens, the laptop, and whatever her hands are doing.

LIGHTING. Soft morning daylight through the sheer-curtained window from frame-right, the only meaningful source. Warm-neutral, roughly 5200K. Soft open shadows, gentle wrap off the white bedding and pale walls. Because the light comes from frame-right and she sits three-quarter, it rakes softly across her cheekbone — the side nearer the lens falls into gentle shadow, the far side is lit. No ring light, no lamps on, no golden-hour glow, no cinematic grading.

WARDROBE. She wears a white ribbed tank top with a dark gray zip-up hoodie slipping off her shoulders, a shell necklace, thin pendant necklace, and rings. Her brown hair is up in a messy bun with loose bangs and face-framing strands, individual flyaways catching the window light.

MOUTH AND TEETH. Copy how she actually talks in the reference images. Her mouth opens modestly and naturally as she speaks — lips parting just enough for the words, mostly the edges of her front upper teeth showing on open vowels, lower teeth almost never visible. She never talks through a wide toothy grin. A full open smile with teeth appears only at the smile beats marked in the recording below — brief, then back to a natural talking mouth. Between sentences her mouth closes or holds a small soft shape. Never freeze her mouth open, never bare all her teeth while she is speaking.

DELIVERY. Natural American accent, warm and a little conspiratorial, like telling a friend a secret. Her pacing matches the provided voiceover recording exactly — her recorded read is the timing and tone reference, including where she breathes and pauses. Exactly two arms, five fingers per hand.

DIALOGUE — LOCKED VERBATIM. She speaks exactly these words, in exactly this order, at exactly these timestamps, matching the provided voiceover recording. No improvisation, no rewording, no reordering, no additions, no omissions. This is the complete and only dialogue in the video.

LINE 1 (0.1s-5.8s) — "It's honestly scary how good AI has gotten because I bet you thought that this was actually me"
LINE 2 (6.4s-8.0s) — "But I literally cloned myself"
LINE 3 (8.7s-11.1s) — "The voice you're hearing right now is a clone"
LINE 4 (11.5s-16.2s) — "This video of me isn't real, and this room I'm in doesn't exist"
LINE 5 (17.0s-20.5s) — "I made my clone in Arcads in like ten minutes from one video"
LINE 6 (21.0s-23.4s) — "Then I made this video from a single prompt"
LINE 7 (24.2s-28.6s) — "If you want the exact prompt I used, comment 'clone' and I will send it to you"

CONTINUOUS BEHAVIOUR. She is never still or neutral. Across the full recording: eyebrows move constantly with her speech, lifting on emphasis. She blinks at irregular intervals, sometimes twice in quick succession. Her mouth stays active between words — small lip presses, a slight purse while thinking. Her head makes small tilts and nods tracking her own sentences. Shoulders shift and settle. Her hands are almost never at rest; when not gesturing they touch the desk edge, the cold glass, a loose strand of hair. She glances slightly off-camera, then finds the lens again, the way real people do mid-thought. She never freezes to deliver a line.

SKIN AND DETAIL. Natural skin texture at maximum under the raking window light, which hides nothing: visible pores across the nose and inner cheeks, fine peach fuzz along the jaw catching the side light, natural oil sheen on the forehead and nose bridge, faint undereye shadows, individual eyebrow hairs separated. No smoothing, no beauty filter, no plastic skin, no airbrushed finish.

AMBIENT SOUND. Phone-mic room tone throughout: her voiceover, soft birdsong through the window, a quiet chair creak when she sits, the glass touching wood, a soft shift of ice, the laptop hinge. No music, no sound effects, no polish.

THE RECORDING, IN ORDER

(0.0s-5.8s) The recording is already running. She is mid-stride, walking through the villa toward the bedroom, filming herself selfie-style — the camera held at arm's length slightly above eye level, her face centered, the hallway and warm wood walls passing behind her. Her left hand holds a tall skinny glass of iced latte with a straw, visible at the bottom of frame. The frame bounces softly with each step. At 0.7s exposure re-levels as she enters the brighter bedroom. Rolling-shutter jello runs through this stretch. LINE 1 runs from 0.1s, slightly breathy from walking, delivered as one flowing thought. On "actually me" at 5.1s her eyebrows lift and there is an amused breath of a laugh.

(5.8s-6.4s) A natural pause, matching the recording. She reaches the desk and sets the camera down on it in one quick motion, propped facing the chair. The frame swings, tips, and settles with a single decaying wobble. Fingers pass briefly across the bottom edge of the lens. Autofocus hunts and locks by 6.4s. The camera now remains in this exact position from 6.4s to 28.6s.

(6.4s-8.0s) LINE 2. She drops into the desk chair while saying it — the sit and the words happen together, no settling first. The chair creaks softly.

(8.0s-8.7s) A natural pause, matching the recording. She sets the iced latte down beside the laptop — a quiet glass-on-wood sound, the ice shifting once.

(8.7s-11.1s) LINE 3. On "the voice you're hearing right now" at 9.5s she points lightly at her own throat, then her hand drops. Her eyes hold the lens.

(11.1s-11.5s) A short breath, matching the recording. She leans in, elbows finding the desk.

(11.5s-16.2s) LINE 4. On "this room I'm in doesn't exist" at 14.8s she gestures loosely at the room behind her, palm up, one beat, not presentational. A small closed-mouth smile on the last word.

(16.2s-17.0s) A natural pause, matching the recording. She flips the laptop open with one hand, the hinge whispering, the screen lighting her face faintly from below.

(17.0s-20.5s) LINE 5. She glances at the laptop screen at 19.1s, then back up at us. Her delivery warms on "ten minutes."

(20.5s-21.0s) A short beat, matching the recording. A quick raised-eyebrow moment, mouth pressing.

(21.0s-23.4s) LINE 6. On "a single prompt" at 22.7s she points at the laptop screen lightly. Small smile on the last words.

(23.4s-24.2s) A natural pause, matching the recording. She settles back in the chair, shoulders dropping, direct to camera now.

(24.2s-28.6s) LINE 7, unhurried. A tiny breath at 26.0s, matching the recording. On "comment 'clone'" at 26.9s she gives one small point down toward the bottom of the frame. The last words land warm, a real smile arriving late at 28.1s.

(28.6s-29.0s) Silence. She holds the smile, one natural breath, then reaches forward. Her hand enters frame, going soft and dark as it nears the lens, and the frame tips as the camera is lifted off the desk. The recording stops there, mid-motion, still running until the instant it ends.

AVOID. No cinematic lighting, no professional camera look, no studio setup, no ring light, no color grading, no filters, no smoothing, no text overlays, no subtitles, no captions, no logos, no watermark, no music, no second person in frame, no phone visible in frame.

SAVE THIS PAGE

Final checklist

☐ Source frames all show one consistent look
☐ At least one useful mouth/smile reference
☐ Final script recorded cleanly at the intended length
☐ First prompt used only to build the Workspace
☐ Full master prompt pasted into the video generation node
☐ Every image wired to IMAGE
☐ Final audio wired to AUDIO
☐ Seedance 2.5 / 9:16 / 30 seconds / Audio ON
☐ One test generated before adding complexity

> **The shortest possible version**
> Frames + clean audio → first prompt builds Workspace → replace image/audio/generic prompt → Seedance 2.5, 9:16, 30s, Audio ON → run → your AI clone video is ready.

More prompts and tutorials are posted in my free Skool community. Join here: https://www.skool.com/the-consistency-
